

HEXOS ABOUT

HEXOS (Pronounxed “Hex-Us”, stands for Hex Operating System) is my take on a Gmunk-Inspired operating system which would be used in some far-flung futuristic world. I will be attempting to create a sort of “desktop environment”, with a select number of features the user can interact with and explore. The goal is to create a believable (albeit extremely minimalistic) operating system, something you’d see some awesome 1337 cyberpunk hacker utilizing.

I will be using bare JavaScript for this project in an attempt to learn more about the HTML5 Canvas API. I will be attempting to approach this with object orientated JS (utilizing prototype objects). My biggest concern is how to develop the interactivity with canvas elements, which will be an interesting challenge. I may incorporate jQuery or EaseJS (JS animation library) into this project. The project will also utilize Github in attempts to become more familiar with the general repository procedure for this & future work.
